Creating a Knowledge Base

A Knowledge Base refers to an advanced, centralized **enterprise-specific repository of information** that is not only structured for human comprehension but is also optimized for machine understanding. It leverages Artificial Intelligence to draw inferences and provide more contextually relevant and personalized responses to user queries.

Enterprise-specific knowledge bases play a pivotal role in GEN AI solutions for enterprises by offering tailored insights and solutions that are highly relevant to the organization's unique context and requirements.

For example, consider a business user tasked with analyzing portfolio performance for a group of clients. Instead of manually sifting through numerous documents or databases, the business user interacts with the firm's AI-powered Agent. They input a query such as, "Retrieve recent portfolio returns for clients in the XYZ investment group." Integrated with the Knowledge Base, the system comprehends the user's request and swiftly retrieves the relevant portfolio performance data for clients within the specified investment group.

Users must have one of the following policies to create a Knowledge Base.

- **Administrator Policy**
- **Gen AI User Policy**

This guide will walk you through the steps on how to create a Knowledge Base.

1. Upload documents
2. Initiate knowledge base creation
3. Import documents
4. Configure a chunking strategy
5. Choose an embedding model
6. Metadata tagging for chunks
7. Experiment/test the Knowledge Base
8. Publish the Knowledge Base

Step 1: Upload documents

Upload the required documents in the Document Library to avail the documents during Knowledge Base creation. For more information on how to upload documents, see [Upload documents](#).

Note: Skip this step if you have already uploaded the required documents to the Document Library.

Step 2: Initiate knowledge base creation

1. Head to **Asset Studio**, and choose the **Knowledge hub** tab.

2. In the **Knowledge hub** section, click **Create Knowledge**.

3. In the **Create Knowledge base** window, enter the unique Knowledge Base **Name** and the **Description**.

122 / 200

Cancel Create

4. Click **Create** to initiate the creation of the Knowledge Base.

Step 3: Import documents

1. On the Knowledge Base creation page, click **Import documents**.

- Alternate option: click  and choose the **Import documents** option.

2. In the **Documents** window that appears, select the required documents.

3. Click **X** to close the window.

Step 4: Configure a chunking strategy

Document chunking refers to breaking down large documents or data sets into smaller, more manageable chunks for processing.

Document chunking is a technique that improves the performance and cost efficiency of Gen AI platforms by allowing parallel processing, resource optimization, scalability, fault tolerance, and cost-effective operation.

The chunking strategy helps the LLM model with better retrieval, fast processing and better understanding. For more information, see [Chunking Strategy](#).

1. On the Import image message that appears, click **Chunk now**.

- **Alternate:** In the menu tab, click **Chunk viewer** and then select  **Configuration**.
2. In the **Configuration** window that appears, choose any one of the following chunk strategies.

Configuration

Chunk Strategy

Breaks input documents into smaller, manageable input units called chunks that improves efficiency and optimises input handling.

Block	
Block	Different blocks such as tables, paragraphs, infographics etc is passed as an individual input unit/chunk
Page	Each page from the document is passed as an individual input unit/chunk
Words	User defined words limit within a page is passed as an individual input unit/chunk

Cancel

Update changes

- 0 **Block:** Choose this option if you wish to chunk the documents by blocks.
Suitable for documents with diverse sections or topics where each block may represent a distinct segment requiring individual processing.
- 0 **Page:** Choose this option if you wish to chunk the documents by pages.
Appropriate for documents with consistent and uniform content, where dividing by page ensures even distribution and manageable sections.
- 0 **Word:** Choose this option if you wish to chunk the documents by words.
Beneficial for content where word-level context is paramount.
 - **Set word limit:** Ensuring that the model processes a specific number of words for accuracy and coherence.

Set word limit

embedding simultaneously in a single operation.

3. Click **Update changes**.
4. You can now get the chunks for each document that you have selected. Click the respective chunk for which you wish to know the chunk details.

Step 5: Choose an embedding model

A vector embedding model is like a special tool that helps a system understand the meaning of words and sentences in a simpler way. It works by turning words and sentences into numbers, which the computer can easily work with.

The embedding model converts the Chunks into Numerical vector representation of the actual content that is understandable by LLMs to generate output.

1. After chunking, click **RAG Viewer** and then click  Configuration.

- **Alternate:** In the menu tab, click **Chunk viewer** and then select  Configuration.
2. In the configuration window that appears, enable the **Embedding** option.

3. Choose any one of the following embedding models to convert the Chunks into Numeric vector representation.

- 0 **Azure OpenAI Text Ada 002**

0 **Amazon Titan Embed Text v2**

4. Click **Update changes** to initiate embedding.

5. You can identify the embedded chunks with an **Embedded** label.

Step 6: Metadata and tagging for chunks

Add metadata

Metadata is a systematic way to communicate information about content. It is significant because it facilitates the discovery, usage, and preservation of that content by establishing a consistent mechanism and terminology.

Metadata for documents could include information such as title, author, publication date, journal or conference name, abstract, keywords, citations, and more.

1. In the Knowledge base creation page, select the required chunks for which you wish to add metadata.

2. Select **Add metadata** option that appears against the selected chunk(s).

Add metadata

3. In the **Metadata** window that appears, enter the **Name** and **Value** that you wish to add as metadata for the selected chunks.

The screenshot shows a 'Metadata' window with two input fields. The first field is labeled 'Name' and contains the text 'Company'. The second field is labeled 'Value' and contains a button with the text 'AMK Legal' and a small 'x' icon. Below these fields is a '+ Fields' button. At the bottom right are 'Cancel' and 'Submit' buttons.

4. Optional: Use **+ Fields** to add more Metadata.
5. Click **Submit** and view the added metadata details at the bottom of the chunk.

The screenshot shows a document viewer with three chunks of text. Each chunk has a metadata bar at the bottom. The first chunk's metadata bar shows 'Company: [AMK Legal]' and 'Year: [2024]'. The second chunk's metadata bar shows 'Company: [AMK Legal]' and 'Year: [2024]'. The third chunk's metadata bar shows 'Company: [AMK Legal]' and 'Year: [2024]'. The document content includes a logo description, a reference number, and a form of authority.

Add Tag

Tagging in document retrieval involves assigning descriptive keywords or labels to documents based on their content or user-defined categories.

Tagging helps to effectively organize and retrieve information, speeding the search procedures

and improving efficiency and performance of the model.

1. In the Knowledge base creation page, select the required chunks that you wish to add tag.

2. Select **Add tag** option that appears against the selected chunk(s).

3. In the **tags** window that appears, enter the tag name and press **Enter** then click **Submit**

4. You can view the added tags in the bottom of the chunks.

Step 7: Experiment/test the knowledge base

1. In the Knowledge base creation page, click **RAG Viewer**.

2. In the Search bar, enter your required query to filter the chunks and press **Enter**.

3. Based on the query you entered, you can view the respective chunks of information.

- Click  option and choose the metadata and tags that are associated with the chunks for better filtration.

Apply

- Click **Apply** to get the filtered chunks.

Step 8: Publish the knowledge base

1. If the desired Knowledge Base has been created, click **Publish**.

2. Click **Publish** and the status of the Knowledge Base changes to **Published** and can be accessed in the **Asset Studio**.
